Soundwaves of New England now certified for Audio Calibration and Correction

Yarmouthport, MA – March 1, 2008 – Soundwaves of New England has recently been certified by the high-end industrial electronics company, Audio Control, to operate their specialized, digital calibration and correction equipment.

According to Soundwaves' owner, Darren Grebe, "The drastic difference between an uncorrected Home Theater Room and a fine-tuned room, is immediately apparent when you've been able to compare them. Most people have not even heard a correct room, as most are simply "adjusted" with no equipment and no experience. I've been trained to judge as objectively as possible the characteristics of a system within a certain room, and I'm now certified to use the "lasys HT" Digital Home Theater Analyzer, the "SA-3051" 1/3 octave Real Time Analyzer, along with the units that can actually perform the correction; the Diva, Bijou and Maestro systems. I can now make any room sound *much* better."

The use of the lasys HT and the SA-3052 allow the certified calibrator to adjust *frequency response* (so that you have a balanced system from the lowest note to the highest note), *phase relationship* (which makes everything happen in the same "phase" for cohesiveness), *level adjustment* (so that all speakers are truly the same volume) and *time alignment* (which makes sure all the sounds arrive at your ear at precisely the same time – within 1 microsecond). Additionally, the lasys HT allows us to apply digital filters and limiters to protect your system, digital compressors so you can listen at night without waking up the kids, and it has parametric equalizers which are like surgical lasers, allowing them to

directly hone in on small anomalies and eliminate them with no adverse effects.

The "Diva" digital room correction processor is an industrial, 8 channel, 24-bit digital processor with memories. The time alignment feature alone can dial-in your system so that it can digitally "move" a speaker forward or backward by as little as 1/8". This unit will bring out ALL the potential in almost ANY system.

Audio Control has been in business for over 30 years and has been the leader in acoustical measurement & correction devices, processors,

amplifiers and equalizers. They are located north of Seattle in the Pacific Northwest and EVERY unit they produce is **Made In America!** Plus, being in the Northwest, they have been a **Green** company for some time. Not only do they use lead-free solder, but they are a zero-discharge company, meaning that they discharge no liquids except water. A truly amazing fact when you consider the waste generated by manufacturing facilities. Darren Grebe states, "I've been working closely with Audio

Control since the early 90's in the car audio industry and I own (and love) some of their equipment. When it came time for me to be certified, I chose Audio Control because of my experience and their reputation. I couldn't be happier."

After a room is corrected, the final result is a more lifelike, engrossing experience while watching movies – in fact, you will become part of the movie – just like the director intended. After all, some of these movies used Audio Control equipment during their production. It also makes your music listening experience more lifelike and satisfying. You can also take an existing home theater or screening room to calibrate and correct.

Call Darren at (508) 362-7905 to set up a demonstration to see first hand what this can do for your system.
